LETTER OF TRANSMITTAL

Raleigh, North Carolina
October 8, 1953

The Honorable William B. Umstead
Governor of North Carolina
Raleigh, North Carolina

Dear Governor Umstead:

I have the honor of transmitting the report for the Public Health Statistics Section of the Epidemiology Division, State Board of Health, covering the calendar year 1952.

Respectfully submitted,

J. W. R. NORTON, M. D.
Secretary and State Health Officer

INTRODUCTION

The thirty-seventh annual report, Part II, of the Public Health Statistics Section, formerly known as the Bureau of Vital Statistics, presents tabular information regarding North Carolina's population, births, deaths, and stillbirths. The majority of the tabulations are by place of residence; selected tabulations, in whole or in part, are given by place of occurrence. Communicable disease morbidity data are shown in Part I of the annual report of the Section which is printed separately.

Reports have been published annually since 1914 with the exception of the years 1918 and 1919.

Certificates of births, deaths, and stillbirths occurring in 1952 that were filed in 1952 and the first three months of 1953 are included in this report. It is estimated that vital events occurring in 1952 but reported after the first three months of 1953 will comprise less than two per cent of the total 1952 events. There are strong indications that registration in the state has been improving in recent years. The certificates are more complete and accurate and on the average have been filed more promptly.

Again in 1952 a tabulation was made of all birth and death certificates filed in 1952 by year of occurrence (see 1950 or 1951 annual report for explanation of interpretation). This was done in an effort to determine the per cent of certificates filed in time to be included in an annual report as compared with those filed too late to be included. The results of this study are shown in Table 8 of this report. This tabulation was prepared by county of residence in order to make available a correction factor that could be used by each county to more accurately calculate the natality and mortality rates.

Natality

In 1952 there were 111,000 live births occurring to mothers who were residents of the state. All births were allocated to the place of residence of the mother regardless of the place of birth or the length of residence. Births occurring in hospitals, sanatoria, and all other institutions, were allocated to the place where the mother lived. Births occurring on military bases to military

personnel were allocated according to the residence shown on the certificate. The crude birth rate was 26.6 births per 1,000 population. There were 73,972 white births and 37,028 nonwhite births. For the seventh consecutive year, over 100,000 births were recorded.

This state defines a stillbirth as a fetus showing no evidence of life after complete birth if the twentieth week of gestation has been reached. There were 2,499 resident stillbirths reported resulting in a rate of 22.5 stillbirths per 1,000 live births. If stillbirths were considered as a single cause of death, they would rank fourth between cancer and influenza and pneumonia as a leading cause of death.

Premature Births

In order to achieve uniformity in the classification of premature infants in need of special care, and comparability of statistical data in hospitals and in studies of such infants, the definition of the American Academy of Pediatrics has been adopted; that is, a premature infant weighing 2500 grams or less at birth regardless of the period of gestation.

In 1952, there were 9,577 resident premature live births reported among 111,000 live births. Birth weight was reported on all but 570 certificates filed in 1952. Consequently, at least 8.7 per cent of the newborn babies weighed less than 5 pounds and 9 ounces at birth. The number of premature infants by birth weight and age of mother are shown below:

RESIDENT PREMATURE LIVE BIRTHS BY COLOR AND WEIGHT:
NORTH CAROLINA, 1952

Weight Groups (500 gram intervals)	Total	White	Other
	Total	9,577	5,788
500 grams or less.....	54	29	25
501 grams—1000 grams.....	452	282	170
1001 grams—1500 grams.....	857	510	347
1501 grams—2000 grams.....	1,781	1,071	710
2001 grams—2500 grams.....	6,433	3,896	2,537

*Weight groups: 1. 500 grams or less; 2. 501 grams—1000 grams; 3. 1001 grams—1500 grams; 4. 1501 grams—2000 grams; 5. 2001 grams—2500 grams.

Mortality

There were 32,095 resident deaths recorded in 1952. The crude death rate was 7.7 deaths per 1,000 estimated population. Deaths were allocated to the place where the deceased resided unless the place of death item indicated that the deceased had been in the place of death for one year or more. In such cases they were allocated to the place of death, unless the death occurred in an institution. If this was the case, they were allocated to the place of residence, regardless of the length of stay in the institution.

Diseases of the heart, as they have been for the past 32 years, were responsible for more deaths than any other cause, accounting for approximately one-third of all deaths for the year.

All mortality statistics shown by cause in this report are classified according to the Sixth Decennial Revision of the International Lists of Diseases and Causes of Death. This is the fourth year that this revised statistical code has been applied to the causes of death; therefore, some attention must be given to the effects of the revision on certain causes of death before comparison with previous years can be made accurately.

The most important feature of this revised classification procedure is the emphasis that is placed on the underlying cause of death, as determined by the attending physician. The physician's statement is used as the determining factor when two or more

causes of death are entered. Approximately 75 per cent of the death certificates have two or more causes entered in the medical certification section. For the decade, 1939-1948, the selection of the cause of death for tabulation was made according to joint-cause rules which established priority of cause based on certain factors rather than on the physician's opinion.

In Table 14, regarding deaths from selected causes, 1916-1952, it is necessary to take into consideration the effect of the revision of the International List and of the joint-cause of death coding procedure. A comparability ratio may be obtained upon request. This ratio is calculated from the approximate change that has taken place due to coding revisions between the periods, 1949-1952 and prior years, 1939-1948. This ratio was obtained by classifying deaths according to the Fifth Revision of the International Code as well as by the Sixth Revision and then basing the ratio on the changes derived.

Hospital Data

All tables in this report which reflect events occurring in hospitals are based on the general and allied hospital definition of the North Carolina Medical Care Commission. A hospital is defined as a place where two or more nonrelated individuals reside 24 hours or more on the premises and receive medical care over and above any domiciliary care.

Infant and Maternal Mortality

There were 3,929 infant deaths and 113 maternal deaths reported. The resultant infant and maternal deaths per 1,000 live births were 35.4 and 1.0 respectively. The maternal mortality rate was the lowest on record. The actual number of maternal deaths represent a new low dating back to 1914.

In 1918, there was an all-time high rate of 101.8 infant deaths per 1,000 live births. The infant mortality rate was almost three times as high thirty-four years ago as it was in 1952 while the maternal rate was ten times as high at that time.

Rates

All rates shown in this report are crude rates unless otherwise specified. Such rates have not been adjusted for differences in the age, sex, color, rural or urban distribution of the population, or for under-registration or late reporting. Such factors should be kept in mind when comparing two different areas or time periods.

*All population estimates by U. S. Census Bureau except 1951 and 1952 which were estimated by PHSS. Census years 1920, 1930, 1940, 1950 not estimated. Number births and deaths revised in accordance with national reports published 1917-1950 for births, and 1916-1950 for deaths.

a Stillbirths included in births 1914, 1915.

b Births, deaths, infant deaths, and maternal deaths by place of residence, 1939-1952; previous years by occurrence.

*1916-1949 data from NOVS reports; 1950-1952 from N. C. reports. Data by place of occurrence, 1916-1938; by place of residence, 1939-1952.

**Includes all accidents except motor vehicle; legal executions included 1916-1929.

***Coded by the 6th Revision of the International Classification.
